Description

Abstract: Assessment of pain is critical to providing good pain management. Based on evidence-based clinical guidelines three pain care clinical decision support alerts were deployed on the Practice Fusion cloud-based EHR platform. The program design consisted of matched test and control practices. Provider acceptance of pain care prompts was positive and sustained over six months with completion of prompted actions including pain scores, brief pain inventories, and care plans higher in test than control practices.

Learning Objective 1: Understanding the value of clinical decisions support in chronic pain management

Learning Objective 2: Provide examples of a sustainable response to a CDS module for chronic pain management
